Rationalism, in Western philosophy, the view that regards reason as the chief source and test of knowledge. Holding that reality itself has an inherently logical structure, the rationalist asserts that a class of truths exists that the intellect can grasp directly. There are, according to the rationalists, certain rational principles—especially in logic and mathematics, and even in ethics and metaphysics —that are so fundamental that to deny them is to fall into contradiction.

Rationalism is a branch of epistemology which studies people's opinions applying to reason as a foundation of knowledge and justification. It is the theory in which the principle of truth is not sensory but academic and deductive. There are varying degrees of emphasis on rationalism. This has led to a variety of rationalist perspectives from the average position that reason has priority over other ways of gaining knowledge.

The dispute between rationalism and empiricism concerns the extent to which we are dependent upon sense experience in our effort to gain knowledge. Rationalists claim that there are significant ways in which our concepts and knowledge are gained independently of sense experience. Empiricists claim that sense experience is the ultimate source of all our concepts and knowledge.

Rationalism in its purest form goes so far as to hold that all our rational beliefs, and the entirety of human knowledge, consists in first principles and innate concepts (concepts that we are just born having) that are somehow generated and certified by reason, along with anything logically deducible from these first principles.

There are some disputes among rationalists on the extent of rationalism: 1.) ALL knowledge and ideas are from ratio (Plato and Leibniz) Plato distinguishes between belief and knowledge. Knowledge = certain. Belief = open to doubt 2.) SOME knowledge and ideas are from ratio

Modern philosophy has been vexed by the question "Why should I be moral?" and by doubts about the rational authority of moral virtue. In *Reasons without Rationalism*, Kieran Setiya shows that these doubts rest on a mistake. The "should" of practical reason cannot be understood apart from the virtues of character, including such moral virtues as justice and benevolence, and the considerations to which the virtues make one sensitive thereby count as reasons to act. Proposing a new framework for debates about practical reason, Setiya argues that the only alternative to this "virtue theory" is a form of ethical rationalism in which reasons derive from the nature of intentional action. Despite its recent popularity, however, ethical rationalism is false. It wrongly assumes that we act "under the guise of the good," or it relies on dubious views about intention and motivation. It follows from the failure of rationalism that the virtue theory is true: we cannot be fully good without the perfection of practical reason, or have that perfection without being good. Addressing such topics as the psychology of virtue and the explanation of action, *Reasons without Rationalism* is essential reading for philosophers interested in ethics, rationality, or the philosophy of mind.

This collection of essays has evolved through the co-operative efforts, which began in the fall of 1974, of the participants in a workshop sponsored by the Fritz Thyssen Foundation. The idea of holding one or more small colloquia devoted to the topics of rational choice in science and scientific progress originated in a conversation in the summer of 1973 between one of the editors (GR) and the late Imre Lakatos. Unfortunately Lakatos himself was never able to see this project through, but his thought-provoking methodology of scientific research programmes was ably expounded and defended by his successors. Indeed, this volume continues and deepens the debate inaugurated in *Criticism and the Growth of Knowledge* (edited by Imre Lakatos and Alan Musgrave), a book which grew out of a conference held in 1965. That debate has continued during the years that have passed since that conference. The group of discussions about the place of rationality in science which have been held between those who emphasize the history of science (with Feyerabend and Kuhn as the most prominent exponents) and the critical rationalists (Popper and his followers), with Imre Lakatos defending a middle ground, these discussions were seen by almost all commentators as the most important event in the philosophy of science in the last decade. This problem area constituted the central theme of our Thyssen workshop. The workshop operated in the following manner.

Traditional philosophical accounts of the scientific enterprise represent it as a paradigm of institutionalized rationality. The scientist is held to possess a special method which he disinterestedly applied, generating an accumulation of scientific knowledge about the world, and the evolution of science is seen as being determined by the rational deliberations of scientists and not by psychological or sociological factors. More recently, various philosophers, historians and sociologists of science have held that this rational model is no longer tenable. Some have claimed that there is no such thing as a scientific method or scientific progress, and that theories are incommensurable and so there is no possibility of choice between alternative theories. The more extreme non-rationalists seek to explain scientific change exclusively in terms of psychological and sociological factors. In this book, the author explores the controversy between the two approaches and presents a strongly critical and independent view of both rationalists like Popper and Lakatos and non-rationalists such as Kuhn and Feyerabend. He goes on to develop his own account of the scientific enterprise--temperate rationalism, a vindication of the rationalist approach to science and of a realist construal of theories.--

outlook that unites several philosophers and discusses the most important philosophical issues bearing on the subject, while maintaining enough distance from, say, the intricacies of Locke, Berkeley, Hume scholarship to allow students to gain a clear overview of empiricism without being lost in the details of the exegetical disputes surrounding particular philosophers. Written for students the book can serve both as an introduction to current problems in the theory of knowledge as well as a comprehensive survey of the history of empiricist ideas. The book begins by distinguishing between the epistemological and psychological/causal versions of empiricism, showing that it is the former that is of primary interest to philosophers. The next three chapters, on Locke, Berkeley, Hume respectively, provide an introduction to the main protagonists in the British empiricist tradition from this perspective. The book then examines more contemporary material including the ideas of Sellars, foundations and coherence theories, the rejection of the a priori by Mill, Peirce and Quine, scepticism and, finally, the status of religious belief within empiricism. Particular attention is paid to criticisms of empiricism, such as Leibniz's criticisms of Locke on innatism and Frege's objections to Mill on mathematics. The discussions are kept at an introductory level throughout to help students to locate the principles of empiricism in relation to modern philosophy.

Throughout the ages one of the central topics in philosophy of religion has been the rationality of theistic belief. This book proposes that parties on both sides of this debate might shift their attention in a different direction, by focusing on the question of whether it is rational to be a religious theist. Explaining that having theistic beliefs is primarily a cognitive affair but being a religious theist involves a whole way of life that includes one's beliefs, Golding argues that it can be pragmatically rational to be a religious theist even if the evidence for God's existence is minimal. The argument is applied to the case of Judaism, articulating what is involved in religious Judaism and arguing that it is rationally defensible to be a religious Jew. The book concludes with a discussion of whether a similar argument might be constructed for other versions of religious theism such as Christianity or Islam, and for non-theistic religions such as Taoism or Buddhism. Joshua Golding offers a carefully wrought explanation of how it can be rational for someone to live a religious life, in particular (but not necessarily only), a traditional Jewish life.

A comprehensive defence of the rationalist view that insight independent of experience is a genuine basis for knowledge.

The three great historical philosophers most often associated with rationalism - Descartes, Spinoza and Leibniz - opened up ingenious and breathtaking vistas upon the world. Yet their works are so difficult that readers often find themselves stymied. "Understanding Rationalism" offers a guide for anyone approaching these thinkers for the first time. With clear explanations, elegant examples and insightful summaries, "Understanding Rationalism" unlocks their intricate metaphysical systems, which are by turns surprising, compelling and sometimes bizarre. It also lays out their controversial stances on moral, political and religious problems. The study is framed by an opening discussion of the broad themes and attitudes common to these three philosophers and a closing analysis of the legacy they left for the rest of philosophy.
