Answer: Suppose that the present age of the son is =  $x$  years. Then the father's age is  $(60 - x)$  years. Notice that we are trying to reduce the problem into as few variables as possible. As per the second condition of the question, we have: The age of the father six years ago =  $(60 - x) - 6$  years =  $54 - x$  years.

Shaheena's age will be  $s + 10$  The problem also says that Mia will be twice as old as Shaheena. The statement above gives the following equation  $m + 10 = 2 \times (s + 10)$   $m + 10 = 2 \times s + 2 \times 10$   $m + 10 = 2s + 20$  You now have a system of linear equation to solve  $m + s = 40$

To what extent is age inevitably linked with declining capacity? What are the goals of a policy on age equality, and how can these be realized in law? How should law and policy address age discrimination in health, education and employment? Should young people be dealt with in the same way as older people? This book answers these questions in a series of chapters by experts from a wide range of disciplines. It examines the nature of the aging process and provides a detailed analysis of the concept of age equality.

explained by using the tools of the social sciences and statistics. It moves from a discussion of formulating theories about real world phenomena to lessons on how to analyze data, test theories, and make predictions. Through the use of a rich array of examples, the book demonstrates the power and range of social science and statistical methods. In addition to “big” topics—presidential elections, Federal Reserve behavior, and inflation—and “not quite so big” topics—wine quality—the book takes on questions of more direct, personal interest. Every day young people engage in risky behaviors that affect not only their immediate well-being but their long-term health and safety. These well-honed essays apply diverse economic analyses to a wide range of unsafe activities, including teen drinking and driving, smoking, drug use, unprotected sex, and

criminal activity. Economic principles are further applied to mental health and performance issues such as teenage depression, suicide, nutritional disorders, and high school dropout rates. Together, the essays yield notable findings: price and regulatory incentives are critical determinants of high-risk behavior, suggesting that youths do apply some sort of cost/benefit calculation when making decisions; the macroeconomic environment in which those decisions are made matters greatly; and youths who pursue high-risk behaviors are significantly more likely to engage in
