a large class of M/G/1 priority queues, due to Kleinrock [7]. We focus in particular on accumulating priority queues, in which a customer's priority is the product of their current waiting time and some constant determined by their priority class. This queue allows customers to overtake each other in

Queueing theory, a discipline within the mathematical theory of probability, an M/G/1 queue is a queue model where arrivals are Markovian, service times have a General distribution and there is a single server. The model name is written in Kendall's notation, and is an extension of the M/M/1 queue, where

mean-value approach for M/G/1 priority queues. Using the residual life-time formula, Little's formula and the fact that Poisson arrivals see time averages, we derive schemes to evaluate mean response times, mean queue lengths and mean waiting times for the respective priority classes.
