During the past twenty years there has been a dramatic increase in obesity in the United States. An estimated thirty percent of adults in the US are obese; in 1980, only fifteen percent were. The issue is gaining greater attention with the CDC and with the public health world in general. This book will offer practical information about the methodology of epidemiologic studies of obesity, suitable for graduate students and researchers in epidemiology, and public health practitioners with an interest in the issue. The book will be structured in four main sections, with the majority of chapters authored by Dr. Hu, and some authored by specialists in specific areas. The first section will consider issues surrounding the definition of obesity, measurement techniques, and the designs of epidemiologic studies. The second section will address the consequences of obesity, looking at epidemiologic studies that focus on cardiovascular disease, diabetes, and cancer. The third section will look at determinants of obesity, reviewing a wide range of risk factors for obesity including diet, physical activity and sedentary behaviors, sleep disorders, psychosocial factors, physical environment, biochemical and genetic predictors, and intrauterine exposures. In the final section, the author will discuss the analytical issues and challenges for epidemiologic studies of obesity.

Our nation stands at a crossroads. Today's epidemic of overweight and obesity threatens the historic progress we have made in increasing American's quality and years of healthy life. Two-third of adults and nearly one in three children are overweight or obese. In addition, many racial and ethnic groups and geographic regions of the United States are disproportionately affected. The sobering impact of these numbers is reflected in the nation's concurrent epidemics of diabetes, heart disease, and other chronic diseases. If we do not reverse these trends, researchers warn that many of our children—our most precious resource—will be seriously afflicted in early adulthood with medical conditions such as diabetes and heart disease. This future is unacceptable. The Surgeon General asks you to join me in combating this crisis. Every one of us has an important role to play in the prevention and control of obesity. Mothers, fathers, teachers, business executives, child care professionals, clinicians, politicians, and government and community leaders—we must all commit to changes that promote the health and wellness of our families and communities. As a nation, we must create neighborhood communities that are focused on healthy nutrition and regular physical activity, where the healthiest choices are accessible for all citizens. Children should be having fun and playing in environments that provide parks, recreational facilities, community centers, and walking and bike paths. Healthy foods should be affordable and accessible. Increased consumer knowledge and awareness about healthy nutrition and physical activity will foster a growing demand for healthy food products and exercise options, dramatically influencing marketing trends. Hospitals, work sites, and communities should make it easy for mothers to initiate and sustain breastfeeding as this practice has been shown to prevent childhood obesity. Working together, we will create an environment that promotes and facilitates healthy choices for all Americans. And we will live longer and healthier lives. In the 2001 Surgeon General's Call to Action to Prevent and Decrease Overweight and Obesity, former Surgeon General David Satcher, MD, PhD, warned us of the negative effects of the increasing weight of our citizens and outlined a public health response to reverse the trend. Although we have made some strides since 2001, the prevalence of obesity, obesity-related diseases, and premature death remains too high. The Surgeon General is calling on all Americans to join in a national grassroots effort to reverse this trend. Plans include showing people how to choose nutritious food, add more physical activity to their daily lives, and manage the stress that so often derails their best efforts at developing healthy habits. The real goal is not just a number on a scale, but optimal health for all Americans at every stage of life. To achieve this goal, we must all work together to share resources, educate our citizens, and partner with business and government leaders to find creative solutions in our neighborhoods, towns, and cities from coast to coast. Together, we can become a nation committed to become healthy and fit.

The aim of this book is to inform clinicians of recent advances in obesity research and provide a review of current treatment issues and strategies. Part 1 covers new discoveries in the physiological control of body weight, as well as the pathophysiology of obesity. Part 2 covers a range of issues that are central to the clinical management of obese patients. This illustrated volume will stimulate and engage clinicians.

Childhood obesity is highly prevalent in the U.S. and has become a global epidemic. The 2007-2008 National Health and Nutrition Examination Survey data showed that 17% of U.S. children and adolescents (ages 2-19) years were obese, and over 30% were overweight or obese. Childhood obesity leads to obesity in adulthood and many other serious health conditions, such as cardiovascular, metabolic, and psychosocial illnesses. To assess the effectiveness of existing childhood obesity prevention efforts, the Johns Hopkins University Evidence-based Practice Center completed a systematic review on childhood obesity prevention studies conducted in high-income countries. This report systematically reviewed seven key questions: What is the comparative effectiveness of school-based interventions for the prevention of obesity or overweight in children? What is the comparative effectiveness of home-based interventions for the prevention of obesity or overweight in children? What is the comparative effectiveness of primary care-based interventions for the prevention of obesity or overweight in children? What is the comparative effectiveness of childcare setting-based interventions for the prevention of obesity or overweight in children? What is the comparative effectiveness of community-based or environment-level interventions for the prevention of obesity or overweight in children? What is the comparative effectiveness of consumer health informatics applications for the prevention of obesity or overweight in children? What is the comparative effectiveness of multi-setting interventions for the prevention of obesity or overweight in children? Though the strength of evidence is moderate to high for school-based interventions, the limited number of studies and insufficient or low strength of evidence to support interventions in other settings made it difficult to conclude that interventions in other settings could effectively prevent childhood obesity. Based on the evidence gaps in these settings, we identified the following as Future Research Needs: Future research is needed on interventions delivered in settings other than schools or home. While there have been other reviews on the effectiveness of interventions on food and nutrition policies at school on changes in children's diet and school food environments, there are still gaps in the literature on some aspects, such as the impact of regulations on food availability and its impact on obesity prevention. Only a few studies that we reviewed used social marketing to deliver messages on nutrition, physical activity and health. This approach might be integrated with other intervention components to create an atmosphere favorable to healthy and active lifestyles and related behavioral changes. Further testing of the value of consumer health informatics products for obesity prevention is needed. In addition, there is a lack of evidence on the impact of regional or national policies on childhood obesity prevention. Further research might be conducted with stratified analyses on subgroups, such as by gender, age, race/ethnicity, or socioeconomic status. There were methodological limitations of the reviewed studies which suggest that future research might improve upon the methods. Few of the studies we reviewed reported process evaluation, which would provide useful insight regarding why some studies might detect desirable effect of the intervention. Future studies need to design innovative approaches that have a high likelihood of sustainability. This may be designed to take advantage of other existing public health, government or other organization supported programs or try to gain more support and engagement from related key stakeholders. The objective of this report is to prioritize the needs for research addressing gaps in the existing literature on the effectiveness of childhood obesity prevention programs by engaging expert stakeholders using a modified Delphi method.

Promotes the recognition, treatment, and prevention of conditions of overweight and obesity in the United States.

## Online Library Obesity Research Paper

To battle the obesity epidemic in America, health care professionals and policymakers need relevant, useful data on the effectiveness of obesity prevention policies and programs. Bridging the Evidence Gap in Obesity Prevention identifies a new approach to decision making and research on obesity prevention to use a systems perspective to gain a broader understanding of the context of obesity and the many factors that influence it.

Obesity has come to the forefront of the American public health agenda. The increased attention has led to a growing interest in quantifying obesity prevalence and determining how the prevalence has changed over time. Estimates of obesity prevalence and trends are fundamental to understanding and describing the scope of issue. Policy makers, program planners, and other stakeholders at the national, state, and local levels are among those who search for estimates relevant to their population(s) of interest to inform their decision-making. The differences in the collection, analysis, and interpretation of data have given rise to a body of evidence that is inconsistent and has created barriers to interpreting and applying published reports. As such, there is a need to provide guidance to those who seek to better understand and use estimates of obesity prevalence and trends. Assessing Prevalence and Trends in Obesity examines the approaches to data collection, analysis, and interpretation that have been used in recent reports on obesity prevalence and trends at the national, state, and local level, particularly among U.S. children, adolescents, and young adults. This report offers a framework for assessing studies on trends in obesity, principally among children and young adults, for policy making and program planning purposes, and recommends ways decision makers and others can move forward in assessing and interpreting reports on obesity trends.

Obesity continues to accelerate resulting in an unprecedented epidemic that shows no significant signs of slowing down any time soon. The World Health Organization reports that in 2016, nearly 2 billion adults were overweight and that worldwide obesity has nearly tripled since 1975. Obesity: Global Impact and Epidemiology is an important tool in proving a link to new knowledge, serving researchers and clinicians. The field of obesity is evolving very quickly and there is an abundance of scientific data that has emerged and is emerging constantly. Researchers and physicians need new updated information about the epidemiology and global impact of obesity that come from authors that have a wide perspective in the field. For health professionals and researchers, there is a need to understand how obesity begins. While a simple question, the answer is very complex. Serves as a starting point for in-depth discussions in academic settings, leading to revised and updated treatment options for practicing obesity-treatment specialists Offers practical information about the methodology of epidemiologic studies of obesity Updated important source of information for clinicians and scientists in the field of obesity
