Rabies is the most current and comprehensive account of one of the oldest diseases known that remains a significant public health threat despite the efforts of many who have endeavored to control it in wildlife and domestic animals. During the past five years since publication of the first edition there have been new developments in many areas on the rabies landscape. This edition takes on a more global perspective with many new authors offering fresh outlooks on each topic. Clinical features of rabies in humans and animals are discussed as well as basic science aspects, molecular biology, pathology, and pathogenesis of this disease. Current methods used in defining geographic origins and animal species infected in wildlife are presented, along with diagnostic methods for identifying the strain of virus based on its genomic sequence and antigenic structure. This multidisciplinary account is essential for clinicians as well as public health advisors, epidemiologists, wildlife biologists, and research scientists wanting to know more about the virus and the disease it causes. * Offers a unique global perspective on rabies where dog rabies is responsible for killing more people than yellow fever, dengue fever, or Japanese encephalitis * More than 7 million people are potentially exposed to the virus annually and about 50,000 people, half of them children, die of rabies each year * New edition includes greatly expanded coverage of bat rabies which is now the most prominent source of human rabies in the New World and Western Europe, where dog rabies has been controlled * Recent successes of controlling wildlife rabies with an emphasis on prevention is discussed * Approximately 40% updated material incorporates recent knowledge on new approaches to therapy of human rabies as well as issues involving organ and tissue transplantation * Includes an increase in illustrations to more accurately represent this diseases! unique horror

Rabies remains one of the most important global public health problems worldwide. Although many important developments have been made over the past century to combat this ancient disease, Rabies has become a re-emergent infection in the developing world. The 3e updates this classic reference with comprehensive coverage of the molecular virology, pathogenesis, vaccines, public health, immunology, and epidemiology of Rabies. Chapters new to this edition cover biothreat/bioterrorism, successful wildlife control and therapies of human Rabies, and the emergence of new lyssavirus species Rabies provides physicians, public health advisors, epidemiologists, research scientists and veterinarians with single source, authoritative and up-to-date information on the diagnosis, treatment, control and prevention of this fatal infectious virus that continues to kill over 70,000 people a year. Rabies remains a significant global public health risk with over 70,000 deaths a year Alan Jackson a well-known researcher in this subject and has gathered a team of experts to detail the science, treatment, and control of Rabies Completely revised, the 3e presents Rabies as a re-emergent infection with greater emphasis on a global perspective of the virus Provides essential information to anyone diagnosing, treating, controlling and preventing the disease 70 full-color figures highlight important information in microscopic studies

Since the 2015 launch of the Global framework to eliminate human rabies transmitted by dogs by 2030, WHO has worked with the Food and Agriculture Organization of the United Nations, the World Organization for Animal Health, the Global Alliance for Rabies Control and other stakeholders and partners to prepare a global strategic plan. This includes a country-centric approach to support, empower and catalyze national entities to control and eliminate rabies. In this context, WHO convened its network of collaborating centers on rabies, specialized institutions, members of the WHO Expert Advisory Panel on Rabies, rabies experts and partners to review strategic and technical guidance on rabies to support implementation of country and regional programs. This report provides updated guidance based on evidence and programmatic experience on the multiple facets of rabies prevention, control and elimination. Key updates include: (i) surveillance strategies, including cross-sectoral linking of systems and suitable diagnostics; (ii) the latest recommendations on human and animal immunization; (iii) palliative care in low resource settings; (iv) risk assessment to guide management of bite victims; and (v) a proposed process for validation and verification of countries reaching zero human deaths from rabies. The meeting supported the recommendations endorsed by the WHO Strategic Advisory Group of Experts on Immunization in October 2017 to improve access to affordable rabies biologicals, especially for underserved populations, and increase programmatic feasibility in line with the objectives of universal health coverage.The collaborative mechanisms required to prevent rabies are a model for collaboration on One Health at every level and among multiple stakeholders and are a recipe for success.

This book is a printed edition of the Special Issue "Rabies Symptoms, Diagnosis, Prophylaxis and Treatment" that was published in TropicalMed

"Although there is debate about the estimated health burden of rabies, the estimates of direct mortality and the DALYs due to rabies are among the highest of the neglected tropical diseases. Poor surveillance, underreporting in many developing countries, frequent misdiagnosis of rabies, and an absence of coordination among all the sectors involved are likely to lead to underestimation of the scale of the disease It is clear, however, that rabies disproportionately affects poor rural communities, and particularly children. Most of the expenditure for post- exposure prophylaxis is borne by those who can least afford it. As a result of growing dog and human populations, the burden of human deaths from rabies and the economic costs will continue to escalate in the absence of concerted efforts and investment for control. Since the first WHO Expert Consultation on Rabies in 2004, WHO and its network of collaborating centres on rabies, specialized national institutions, members of the WHO Expert Advisory Panel on Rabies and partners such as the Gates Foundation, the Global Alliance for Rabies Control and the Partnership for Rabies Prevention, have been advocating the feasibility of rabies elimination regionally and globally and promoting research into sustainable cost-effective strategies. Those joint efforts have begun to break the cycle of rabies neglect, and rabies is becoming recognized as a priority for investment. This Consultation concluded that human dog-transmitted rabies is readily amenable to control, regional elimination in the medium term and even global elimination in the long term. A resolution on major neglected tropical diseases, including rabies, prepared for submission to the World Health Assembly in May 2013 aims at securing Member States' commitment to the control, elimination or eradication of these diseases. Endorsement of the resolution would open the door for exciting advances in rabies prevention and control."--Publisher's description.

Rabies-as in former times-is still today a major killer affecting man and animals especially in many tropical and sub-tropical countries of Asia, Africa and South America. Some 50,000 people and literally millions of animals suffer and die of this disease each year. This dramatic death toll and the enormous economic losses which ensue are nowadays un tolerable and no longer justified. Worldwide strategy for Rabies control has been established and the World Health Organization recently formulated an elimination programme for dog Rabies. Methods for wildlife Rabies control are also under way. For the realisation of control campaigns, careful epid emiological analysis is necessary. This involves: - antigenical characterisation of Rabies Virus Strains using monoclonal antibodies, - observation of foci, - follow-up of the front wave of the disease, - specific ecology of target populations and Rabies carrier species. The financial point of view of such campaigns has of course to be ascertained. It is for the first time ever that representatives and specialists of different biological disciplines from nearly 70 countries have had the opportunity in Tunis to discuss these important issues and to evaluate, on the basis of their own experimental results and personal epidemiological observations, the possibility of ultimate elimination of Rabies in tropical and sub-tropical countries and also to contribute their share for a better understanding of the natural history of this disease.

Charts the history, science and cultural mythology of rabies, documenting how before its vaccine the disease caused fatal brain infections and sparked the creations of famous monsters including werewolves, vampires and zombies. 15,000 first printing.

Volume 79 of Advances in Virus Research focuses on developments surrounding rabies, an ancient disease that remains a prominent public health problem for humans. This volume highlights important research advances extending from our understanding of how the rabies virus replicates and assembles to how the disease can be prevented and treated in humans and how rabies can be controlled in wildlife hosts. Experts in the field provide insightful and up-to-date chapters that summarize our current state of knowledge in diverse aspects of this very interesting and important viral disease. Contributions from leading authorities and industry experts Informs and updates on all the latest developments in the field

The foundational textbook on the study of virology Basic Virology, 4th Edition cements this series! position as the leading introductory virology textbook in the world. It!s easily read style, outstanding figures, and comprehensive coverage of fundamental topics in virology all account for its immense popularity. This undergraduate-accessible book covers all the foundational topics in virology, including: The basics of virology Virological techniques Molecular biology Pathogenesis of human viral disease The 4th edition includes new information on the SARS, MERS and COVID-19 coronaviruses, hepatitis C virus, influenza virus, as well as HIV and Ebola. New virological techniques including bioinformatics and advances in viral therapies for human disease are also explored in-depth. The book also includes entirely new sections on metapneumoviruses, dengue virus, and the chikungunya virus.
